

Exact Sturm query comparisons: Chebyshev T_8 on $(-2,2)$

4 adjacent AB/BA pairs per endpoint, identical complete result hashes; source bc94cd3e, pinned Z3 4.15.4 / FLINT 3.6.

External timings include JSON and cleanup; black ticks subtract measured protocol median. FLINT uses generic qqbar Horner evaluation (Common especially costly).

These are fixed-degree observations, not size-growth evidence or a portable ranking.
