

Real algebraic operations: cheap list handling, expensive canonical arithmetic

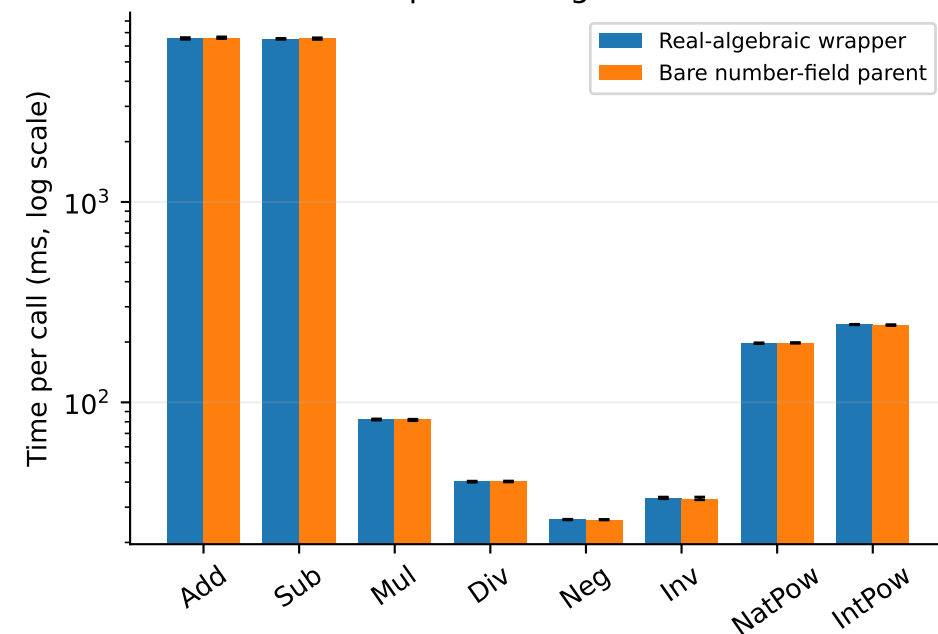

Distinct rational values 1..n

Sort distinct rational root records

Fixed inputs of degrees 6 and 2

Shared host; all retained trials shown, including leading points from earlier model checks. Sources: 4f44b806 (lists), 6d78bf3 (sort/arithmetic).

Arithmetic fixture: positive root of X^6-2 and $\sqrt{3}$; Add/Sub yield degree 12 and take ≈ 6.5 s. Unary operations use only the degree-6 input; bars do not establish growth. Paired wrappers return identical complete hashes.
